

Work of networks

All 100 regions on the ring, grouped by community then by anatomical network. Chords are the 70 strongest between-community connections; within-community connections are omitted, so what remains is the higher-level structure.

Community (regions)

Chord width is streamline count. Chords are grey rather than community-coloured: a chord has two community endpoints, so the palette stays on the arcs where identity is unambiguous. Communities 1 and 2 – wholly left and wholly right – take only 1 of these 70 chords between them.
