

Networks versus communities

The parcellation's a priori functional networks, set against the communities derived from the structural data itself.

A Network × network connectivity

canonical Yeo order, not reordered

B Which partition describes the structure?

higher Q = better structural description

C Communities across networks

regions in common · AMI 0.16

The a priori functional networks describe this connectome worse than splitting the brain in half, and the two partitions barely agree (AMI 0.16 with networks, 0.36 with hemisphere). Structural modules here follow space, not function.
